Intellectual Property Assignment and Prior Art — Anticloud FZ LLE

Anticloud FZ LLE · 0-1.gg · lois@0-1.gg · 2026-10-01T13:21:28Z

Maintainer: Anticloud FZ LLE · 0-1.gg

Contact: lois@0-1.gg

Date: October 2026

Entity: Anticloud FZ LLE, Dubai Free Zone

Ownership: 100% Lois-Kleinner Alpasan → assigned to Anticloud FZ LLE

Overview

All intellectual property developed under Anticloud — software, systems, formats, protocols, algorithms, documentation, research, and derived works — is assigned to Anticloud FZ LLE. The company has established prior art across its core inventions through a documented, timestamped, independently archived corpus of research, code, and specifications. USPTO prosecution is in progress for the primary novel inventions.

Primary IP Assets

1. KANTOR K5 — Post-Quantum Archive Hash

Description: A novel deterministic cryptographic hash construction for AI software archives:

```
SHA3-256(archive_sha3 ■ file_size_le64 ■ project_name_utf8 ■ NULL ■ timestamp_iso)
```

The construction binds archive content, size, project identity, and timestamp in a single verifiable hash resistant to quantum computing attacks. Designed specifically for air-gap AI deployment environments where archive integrity must be verifiable offline.

USPTO Status: Pending. Provisional application in drafting as of 2025–2026. Prior art established and documented (see evidence below).

Prior Art Evidence:

- First public specification: Anticloud corpus, TIER_1_ANTICLOUD_CORE, timestamped and AIOSS-chained, 2025
- Harvard Dataverse archive: DOI 10.7910/DVN/YMJKOG — AIOSS format specification including K5 construction, archived and DOI-assigned
- Internet Archive snapshot: archive.org/details/anticloud-api-oss-fixed-10-research-index
- ORCID research profile: 0009-0009-2233-6107 — linked publications include K5 specification
- Dev.to publication record: 50 articles, multiple referencing KANTOR K5 by name and construction
- Chain hash of originating commit: `8b4a8a4f6312dfbe885de8280716985637c163fd2a4b5590341d56db1cc4e560`

Ownership: Lois-Kleinner Alpasan, assigned to Anticloud FZ LLE

2. AIOSS Format — AI Operating System Software Ledger

Description: An append-only, SHA3-256-chained cryptographic audit ledger for AI inference and software operations. Each entry is:

```
H_n = SHA3-256(H_{n-1} ■ entry_hash_n ■ timestamp_n)
```

The AIOSS ledger provides tamper-evident, independently verifiable proof of every AI inference, software deployment, compliance check, and audit event. Designed for air-gap environments where no external

timestamping authority is available. The format specification defines entry schema, chain verification protocol, and offline verification kit.

USPTO Status: Pending. Covered under same prosecution umbrella as KANTOR K5. Prior art established 2025–2026.

Prior Art Evidence:

- AIOSS offline verification kit: Harvard Dataverse DOI 10.7910/DVN/OORKNJ — independently verifiable chain verification tool, archived and DOI-assigned
- AIOSS format specification: Harvard Dataverse DOI 10.7910/DVN/YMJKOG
- Zenodo (CERN) archive: independently timestamped copy of AIOSS specification
- OSF (Open Science Framework): linked research artifacts referencing AIOSS protocol
- Figshare: additional archival copies
- 123-project corpus: every project in the Anticloud corpus references AIOSS chain verification, all projects AIOSS-signed with HASHES.md

---

3. System of Things (SoT) — Proprioceptive AI Architecture

Description: A neurosymbolic, composable, proprioceptive AI framework where each computational component maintains a typed model of its own state, predicts its next action, produces an AIOSS-chained audit entry, and feeds output back as a proprioceptive signal to the state model. The SoT defines a formal interface language for typed AI components, a self-state representation schema, and a prediction-loop architecture. This constitutes a novel approach to AI system design distinct from nociceptive (stimulus-response) architectures.

USPTO Status: Pending. Included in prosecution scope for Anticloud's core architecture patent family.

Prior Art Evidence:

- SoT specification: documented across TIER_1_ANTICLOUD_CORE and TIER_4_INFERENCE_AGENTS, timestamped and AIOSS-chained, 2025–2026
- Dev.to publications: multiple articles describing SoT framework by name, indexed and cached
- Press release (October 2026): publicly announces SoT as proprietary architecture, syndicated via Yahoo Finance / Business Insider wire
- Harvard Dataverse: SoT architecture overview archived as part of corpus specification

---

4. Anticloud PAX L5 Narrow L2 General 27B — Model Architecture and Training

Description: A 27-billion-parameter language model fine-tuned for regulated-vertical deployment, with Q4 quantization for commodity GPU inference ($0.08/1M tokens on T4). Classification under the Morris et al. (2023) AGI taxonomy at L5 Narrow (superhuman in 5 regulated verticals) and L2 General (50th–90th percentile general). The model's training methodology, quantization pipeline, and benchmark evaluation suite constitute proprietary trade secrets and protectable IP.

USPTO Status: Trade secret protection in effect. Model weights are proprietary. Fine-tuning methodology and evaluation framework pending inclusion in patent prosecution.

Prior Art Evidence:

- Kaggle reproducible benchmark notebook: publicly timestamped, independently verifiable
- OFFICIAL_BENCHMARKS suite: TIER_6_SECURITY_EVAL/K_NANOCHAT/OFFICIAL_BENCHMARKS — run timestamps from 2026-09-30, AIOSS-chained
- 3-seed simulation methodology: seeds 944, 32281, 66480, SHA256(project_name) deterministic — documented in simulation_3seed.md
- ORCID: 0009-0009-2233-6107 — benchmark methodology linked

IP Assignment Chain

Asset	Creator	Assigned To	Date
KANTOR K5 hash construction	Lois-Kleinner Alpasan	Anticloud FZ LLE	2025–2026
AIOSS ledger format and protocol	Lois-Kleinner Alpasan	Anticloud FZ LLE	2025–2026
System of Things (SoT) architecture	Lois-Kleinner Alpasan	Anticloud FZ LLE	2025–2026
PAX L5/L2 27B model + fine-tuning pipeline	Lois-Kleinner Alpasan	Anticloud FZ LLE	2025–2026
123-project corpus (all tiers)	Lois-Kleinner Alpasan	Anticloud FZ LLE	2025–2026
Anticommons Enterprise License 1.0	Lois-Kleinner Alpasan	Anticloud FZ LLE	2025–2026

All assignments are to Anticloud FZ LLE as the legal entity. No third-party IP is incorporated into any core Anticloud invention. All open-source dependencies are Apache 2.0 or MIT licensed with no copyleft provisions that affect commercial deployment.

Prior Art Summary

Anticloud's prior art position is strong across all primary inventions. The prior art is:

1. **Timestamped independently** — Harvard Dataverse DOIs are immutable records with independent timestamps assigned by Harvard University Libraries infrastructure

2. **Publicly accessible** — Internet Archive, Zenodo, OSF, Figshare, Dev.to, and ORCID provide independent public access points not controlled by Anticloud

3. **Cryptographically chained** — Every corpus artifact is AIOSS-signed and K5-hashed, providing tamper-evident evidence of when each invention was documented

4. **Cross-platform corroborated** — The same inventions appear across 8+ independent archival platforms, making retroactive manipulation of dates computationally and institutionally infeasible

The prior art position as of October 2026 is sufficient to support USPTO prosecution and to defend against third-party claims on any of the four primary IP assets.

Third-Party IP Risk Assessment

Risk	Assessment
Base model (27B parameter foundation)	Open-weight base model used under permissive license. Fine-tuning weights are original. No IP risk.
AIOSS chain construction (SHA3-256)	SHA3-256 is a NIST standard. The construction and protocol are novel. No IP risk on underlying primitive.
Apache 2.0 corpus dependencies	All 123 projects audited for license compliance. Apache 2.0 / MIT only. No copyleft. No IP risk.
K5 hash construction primitives	Uses standard cryptographic primitives (SHA3-256, POSIX primitives). Construction is novel. No IP risk on
